

FileXfer

File Transfer Jobs

Raymond E. Marcil
<rmarcil@gci.com>

Revision 0.0.1 (August 10, 2016)

Abstract

The FileXfer application is a system for automated file transfer jobs for copying files. “There are 3 applications that make up the usage collection framework: `filexfer`, which does the actual file transfers; `filexfer-jobmonitor`, which is configured to monitor various aspects of jobs and create NMS alarms when necessary; and `filexfer-dataloader`, which bulk-loads file data into database tables. There are also house-keeping scripts called `filexfer-filearchive`, which keeps files in the data directory pruned and compressed, and `filexfer-fileunarchive`, which allows files to be pulled out of the archive so `filexfer` jobs can work with them again.”¹

1 Introduction

FileXfer is a custom application that GCI OSS built whose primary purpose is to transfer files from point A to point B (most of the time via point C/itself). It can also be used to load the collected data into a database if the data fits within the constraints of MySQL Load Data Infile SQL Syntax. It supports FTP and SFTP for both gets and puts, and it also has limited support for HTTP gets (this feature is used to collect weather camera images off of the Terra mountain top sites for the FAA).²

FileXfer can also be used to prune the source server's target files to a certain number of days. And while the default is to keep the source file time, this feature can be toggle off on a per job basis, resulting in the files having the transfer time instead as some customers prefer to know when the file was dropped off and not when the file was generated. For performance reasons there is a cutoff feature as well which defaults to 5 days for new jobs. FileXfer will not look more than the cutoff days back to see if a file should be collected and/or exported. FileXfer jobs are also capable of running in audit mode, in which FileXfer will log all of the transfers but it won't physically transfer anything. This feature can be useful to get a feed caught up without transferring a bunch of files around if for whatever reason the backlog of files doesn't need to be processed by any customers.

FileXfer logs all file transfers and any errors. However, it is not considered an error if there are no files to collect. FileXfer also supports monitoring of transfer jobs, and can generate an alert for any reason that you can articulate with SQL. Some examples include late and/or missing files, load queue too large, file too small, no files transferred for a certain interval, etc. The monitoring supports internal only alerts, TAC visible alerts, and/or emailing the alerts. The email feature also supports sending of texts to cell phones.

FileXfer will re-transfer a file if either the size and/or source file time changes, as that signals something about the file has changed. Some feeds leverage this concept as they may use a static filename in which the data is simply re-written to same exact file at regular intervals.

The main FileXfer app server is `prod-prov4-cdr1.operations.gci.com` (192.168.161.47). The "ACS" / Project Seward FileXfer app server (which contains only ACS/Project Seward related jobs) is the SPS2 OSS Test app server, `osstest-em-provisioning.operations.gci.com` (192.168.56.4; public IP 66.223.155.33).

²FileXfer.txt:3, GCI Network Services, OSS Mark Blum, Spring 2016

2 Design

[FIXME: Need data here...]

[FIXME: Customize flowchart FileXfer]

3 Schema

The main FileXfer database server is `sadc-cdr-mysql1.operations.gci.com` (192.68.56.189) and the ACS/Project Seward FileXfer database server is the SPS2 OSS Test database server, `osstest-db-provisioning.operations.gci.com` (192.168.69.149). For both database servers the FileXfer database is called `filexfer`.³

Here's a breakdown of the tables:

```
[mblum@development-mark ~]$ mysql -h sadc-cdr-mysql1 -sss \
-e "USE filexfer; SHOW TABLES"
DATABASECHANGELOG
DATABASECHANGELOGLOCK
errors
joblogs
jobs
loadjobs
loadqueue
logs
monitors
```

```
DATABASECHANGELOG
DATABASECHANGELOGLOCK
```

These two tables manage how updates to the database structure of FileXfer are preformed and stored.

3.1 errors

This table stores any errors FileXfer encounters.

3.2 joblogs

This is actually a view. Here's the create statement:

```
CREATE
  ALGORITHM = UNDEFINED
  DEFINER = 'filexfer'@'%'
  SQL SECURITY DEFINER
VIEW 'filexfer`.`joblogs' AS
  SELECT
    'j`.`idJob' AS 'idJob',
    'l`.`idLog' AS 'idLog',
```

³FileXfer.txt:11, GCI Network Services, OSS Mark Blum, Spring 2016

```

    'j'.'jobName' AS 'jobName',
    'j'.'neName' AS 'neName',
    'l'.'srcFileName' AS 'srcFileName',
    'l'.'srcFileSize' AS 'srcFileSize',
    'l'.'srcFileTime' AS 'srcFileTime',
    'l'.'destFileSize' AS 'destFileSize',
    'l'.'destFileName' AS 'destFileName',
    'l'.'dtTransferStart' AS 'dtTransferStart',
    'l'.'dtTransferStop' AS 'dtTransferStop'
FROM
    ('filexfer'.'jobs' 'j'
JOIN 'filexfer'.'logs' 'l' ON (('j'.'idJob' = 'l'.'idJob')));

```

3.3 jobs

This stores all of the transfer jobs. Transfer jobs utilize a cron like schedule, and their run policy can be set to schedule (i.e. run as per the cron schedule), always, and never. There is also a wantSummary field that can be set to either yes or no. Some customers (mainly StarSolutions MSC Usage jobs) want summaries of the transfer file (number of records etc.) and this feature automatically generates that and transfer it along with the file. Priority is another feature of the FileXfer system. Given a limited amount of resources you can set differing priority levels for jobs (1 - 100 with 1 being the highest priority), so that jobs with higher priorities get preference over lower priority jobs when system resources are constrained. Generally production jobs get high priority (5) and lab/test jobs get low priority (100).

The `neName` field, which stands for Network Element Name, basically defines the directory where the files will be stored. They are stored in `/data/usage/[neName]`. Files are automatically archived if they are older than 2 days (to `/data/usage/[neName]/archive`), and archived files are deleted if they are older than 30 days. There is a script that can be used to unarchive files (say for retransfer purposes) called `/usr/bin/filexfer-fileunarchive`. It takes a file mask to unarchive and supports glob syntax.

The `idSite` field is an incomplete feature and not really used at this time.

3.4 loadjobs

This stores all of the load jobs. Not every transfer job has a corresponding load job, and some transfer jobs may have more than one load job.

3.5 loadqueue

This is the queue for the load jobs. Entries in here have yet to be loaded. The loading is done in order.

Here's a SQL query that can be used to view the loadqueue:

```
# FileXfer Load Queue Status
SELECT idJob, idLoadJob, jobName, neName,
IF( idJob = 0, FROM_UNIXTIME( Count ), Count ) AS 'Count', fileName, fileTime
FROM
(
SELECT 0 AS 'idJob', 0 AS 'idLoadJob', 'Current Time' AS 'jobName',
      'neName', UNIX_TIMESTAMP( NOW() ) AS 'Count', 'fileName', 'fileTime'

UNION

SELECT idJob, idLoadJob, jobs.jobName, jobs.neName, COUNT(*),
      fileName, fileTime
FROM filexfer.loadqueue
JOIN filexfer.loadjobs USING ( idLoadJob )
JOIN filexfer.jobs USING ( idJob )
GROUP BY 'idJob'
ORDER BY ( CASE WHEN 'idJob' = 0 THEN 0 ELSE 1 END ) ASC, 5 DESC
) x;
```

3.6 logs

This is the table where all of the transfer logs are kept. In order to retransfer a specific file that has not changed you will have to delete the corresponding log entry. Log entries are never pruned from this table.

3.7 monitors

This table encompasses all of the job monitors. Like load jobs, not every transfer job has a job monitor, and some transfer jobs may have more than one job monitor.

4 Implementation

[FIXME: Need data here...]

4.1 Dependencies

[FIXME: Need data here...]

4.2 Configuration

[FIXME: Need data here...]

4.3 Relevance

[FIXME: Need data here]

4.4 Scripts

The FileXfer app is made up of several scripts which are crond to run, as follows:⁴

```
[root@prod-prov4-cdr1 ~]# cat /etc/cron.d/filexfer
MAILTO=""
PERL5LIB=/opt

# This script preforms all of the get/collect jobs.
* * * * * filexfer /usr/bin/filexfer -c /etc/filexfer/filexfer-get.conf -t get
# This script preforms all of the put/export jobs.
* * * * * filexfer /usr/bin/filexfer -c /etc/filexfer/filexfer-put.conf -t put

# This script runs all of the job monitor jobs, and generates the relevant alerts and/or
* * * * * filexfer /usr/bin/filexfer-jobmonitor -c /etc/filexfer/jobmonitor.conf

# This script runs all of the data loader jobs.
* * * * * filexfer /usr/bin/filexfer-dataloader -c /etc/filexfer/dataloader.conf
#* * * * * filexfer /usr/bin/filexfer-epg-dataloader.plx -c /etc/filexfer/epg-dataloader

# These scripts take care of the archiving
2 0 * * * filexfer for dir in /data/usage/*; do /usr/bin/filexfer-filearchive $dir >>/va
5 0 * * * filexfer find /data/usage -type f -name \*.sum -mmin +43200 | xargs rm
```

FileXfer also has the concept of userscripts. These are scripts that are run after files are collected and before they are exported (in general).

```
[root@prod-prov4-cdr1 ~]# cat /etc/cron.d/filexfer-userscripts
MAILTO=""
PERL5LIB="/opt"
PV_TEST_PERL=1

* * * * * filexfer chmod 644 /data/usage/SDE01P/*
* * * * * filexfer chmod 644 /data/usage/SDE01L/*
0-14 0 * * * filexfer /usr/lib/filexfer/\

```

4.5 Logging

Application Logging

The filexfer applications log to the /var/log/filexfer directory on prod-prov4-cdr1.\operations.gci.com. The parent filexfer jobs log to filexfer-get.log and filexfer-put.log. The jobmonitor and dataloader applications log to jobmonitor.log and dataloader.log. The filexfer applications log to the /var/log/filexfer directory on prod-prov4-cdr1.operations.gci.com. The parent filexfer jobs log to filexfer-get.log and filexfer-put.log. The jobmonitor and dataloader applications log to

`jobmonitor.log` and `dataloader.log`, respectively. Each file transfer job is executed as a child process and gets its own log file. The format is `filexfer-{neName}-{idJob}-{get,put}.log`.

By default, the jobs log at the warn level. Adjust the level to info to get a high-level view of the application's state. Adjust log verbosity by modifying the appropriate config file in `/etc/filexfer`. The changes will take effect after the next program execution.

Errors are also logged to a database table which can be browsed in the filexfer web interface under the 'Logs & Errors' view. This view includes messages logged at **warn**, **error**, and **fatal** severity.⁵

File Transfer Logging

Every file transfer is recorded in a database table. There are two reasons for this table: first, it tells **filexfer** which files have already been transferred, and second, it provides an audit trail for SOX compliance. The table is `filexfer.logs` on `sadc-cdr-mysql1.operations.gci.com`. Use the `filexfer.joblogs` view to easily find logs by job name or network element ID.

File transfer logs may also be viewed in the 'Logs & Errors' page of the web interface.⁶

⁵Usage Collection Framework (filexfer)

⁶Usage Collection Framework (filexfer)

4.6 Test

[FIXME: Need data here...]

4.7 Issues

[FIXME: Need data here...]

5 Operation

There is a FileXfer GUI app on Relevance that can be used to create/delete/update transfer/load jobs and monitors, and view logs and errors. It is available on both presenter 4 on presenter 1 (but at this time it is safer to use presenter 4 to update jobs). Also the lab presenter (lab-presenter4) is currently pointed at the production ACS FileXfer instance.⁷

5.1 Job Scheduling

Jobs are scheduled using a web interface at `nms.operations.gci.com/relevance`. Navigate to the “FileXfer” application and click the “File Transfer Jobs” link. Job execution happens on `prod-prov4-cdr1.operations.gci.com`. A cron job executes every minute from `/etc/cron.d/filexfer` to kick off the various `filexfer` scripts.⁸

New Job

The basic requirements for setting up a transfer new job are as follows:⁹

POC: [for when problems occur]

IP: [source host for collect jobs/destination host for export jobs]

Protocol: [ftp/sftp]

Credentials: [username/password]

File Path:

File Mask: [supports glob syntax]

Schedule: [cron syntax]

Want Summary: [yes/no; generally only for StarSolutions CDR exports]

Job Timing

The parent `filexfer` script is responsible for spawning child processes for each job. Since a large number of jobs can be scheduled at any given interval, the parent process limits how many children can run concurrently. As long as the limit is reached and more jobs need to be spawned, the parent process must stay alive. Since this may take longer than 1 minute, it is possible for `filexfer` to miss certain scheduling intervals.

For example, if 500 jobs are scheduled to run at the top of every hour (`0 * * * *`) and the maximum child process limit is 50, there is a good chance `filexfer` will not execute any jobs scheduled to run at 1 minute past the hour (`1 * * * *`). The best way to avoid this is to use 0, 15, 30, or 45 in the minute field of the job schedule. These intervals are always executed.¹⁰

⁷FileXfer.txt:149, GCI Network Services, OSS Mark Blum, Spring 2016

⁸[Usage Collection Framework \(filexfer\)](#)

⁹FileXfer.txt:139, GCI Network Services, OSS Mark Blum, Spring 2016

¹⁰[Job Timing](#)

5.2 Job Monitoring

[FIXME: Need data here]

5.3 Dataloader

Dataloader jobs are configured using the web interface at `nms.operations.gci.com/relevance`. Navigate to the “FileXfer” application and click the “Data Load Jobs” link. These jobs are executed every minute as long as there are files in the load queue.^{[11](#)}

5.4 Relevance

107 filexfer — Move a file from point A to point B over an IP network
108
109 =head1 VERSION
110
111 0.51
112
113 =head1 SYNOPSIS
114
115 filexfer.plx -c configfile -t {get|put} [options]
116
117 =head1 ARGUMENTS
118
119 =over 4
120
121 =item -c, --configfile
122
123 Specify the configuration file to load. Must be in YAML format.
124
125 =item -t, --transfertype
126
127 One of "get" or "put". Get jobs download files and put jobs upload
    ↪ files.
128
129 =back
130
131 =head1 OPTIONS
132
133 =over 4
134
135 =item -d, --piddir
136
137 Directory where the pid file will be written. Defaults to /var/run
    ↪ /filexfer.
138
139 =item --db
140
141 Sets the database connection parameters. Valid keys are: server (
    ↪ default
142 localhost), port (default 3306), driver (default mysql), uid, pwd,
    ↪ database,
143 and table. Specify tags as key/value pairs, e.g.:
144
145     --db server=localhost --db database=filexfer
```

```
146
147 =item -e, --evengehost
148
149 Address of the Evenge web server. Used to send indicators and
    ↪ events to the NMS system.
150
151 =item --evengetimeout
152
153 Timeout in seconds for communicating with the Evenge web server.
    ↪ Defaults to 10.
154
155 =item -f, --cachefile
156
157 Template cache file location. Defaults to /var/lib/filexfer/
    ↪ filexfer.kch.
158
159 =item -h, --help
160
161 Output this documentation.
162
163 =item -m, --maxchildren
164
165 Maximum number of child processes to spawn. Defaults to 50.
166
167 =item -p, --pidfile
168
169 PID file name. This will be appended with a ".pid" suffix.
170
171 =item -r, --resource
172
173 Resource name of this application. Used in indicator and event
    ↪ messages sent to the NMS system.
174
175 =item --verbose, -v
176
177 Log to the screen at increasingly verbose levels. This option may
    ↪ be repeated
178 multiple times to increase the log level. For example, "-v" logs
    ↪ at info level,
179 "-vv" logs at debug level, and "-vvv" logs at trace level.

63
64 =item -c, --configfile
65
66 Specify the configuration file to load. Must be in YAML format.
67
68 =back
69
70 =head1 OPTIONS
71
72 =over 4
73
74 =item -a, --mailhost
```

```
75
76 Address of the mail server. Used to send email notifications.
    ↪ Defaults to localhost.
77
78 =item -d, --piddir
79
80 Directory where the pid file will be written. Defaults to /var/run
    ↪ /filexfer.
81
82 =item --db
83
84 Sets the database connection parameters. Valid keys are: server (
    ↪ default
85 localhost), port (default 3306), driver (default mysql), uid, pwd,
    ↪ database,
86 and table. Specify tags as key/value pairs, e.g.:
87
88     --db server=localhost --db database=filexfer
89
90 =item -e, --evengehost
91
92 Address of the Evenge web server. Used to send indicators and
    ↪ events to the NMS system.
93
94 =item -f, --cachefile
95
96 Template cache file location. Defaults to /var/lib/filexfer/
    ↪ jobmonitor.kch.
97
98 =item -h, --help
99
100 Output this documentation.
101
102 =item -i, --mailinterval
103
104 Minimum time, in seconds, before repeat emails may be sent for the
    ↪ same monitor. Defaults to 3600 (1 hour).
105
106 =item -l, --mailfrom
107
108 Sender's email address in email notifications. Defaults to [
    ↪ username]@[hostname].
109
110 =item -m, --mailstatfile
```

```
111
112 Mail status file location. Defaults to /var/lib/filexfer/
    ↪ jobmonitor-mailstat.kch.
113
114 =item -o, --mailport
115
116 Port on which the mail server is listening for SMTP traffic.
    ↪ Defaults to 25.
117
118 =item -p, --pidfile
119
120 PID file name. This will be appended with a ".pid" suffix.
121
122 =item -r, --resource
123
124 Resource name of this application. Used in indicator and event
    ↪ messages sent to the NMS system.
125
126 =item --verbose, -v
127
128 Log to the screen at increasingly verbose levels. This option may
    ↪ be repeated
129 multiple times to increase the log level. For example, "-v" logs
    ↪ at info level,
130 "-vv" logs at debug level, and "-vvv" logs at trace level.

L^AT_EX - Examples and Formatting

Comments

COMMENTS Comment — *Sean Weems, Spring 2003*

We should get the COMMENTS column searchable via the landrecords application before we do much anything else – shouldn't be too hard.

Errata: Plats spanning multiple sections

A few anomalies can be observed in the AKPLATS table. Specifically plats exist that span multiple sections. Since the table only has a single column, SCODE, that accepts a single section code, SGU (Status Graphics Unit) has handled this problem by entering multiple rows in the table, each with a different section that point to the same plat or file. Multiple section plats are indicated by setting the TCODE column to the value 37, and making an appropriate notation like *Section 24-25-26-27* in the REMARKS column.

[FIXME: Perhaps the SCODE column should accept an array of sections?]
