

FileXfer

File Transfer Jobs

Raymond E. Marcil
<rmarcil@gci.com>

Revision 0.0.1 (June 30, 2016)

Abstract

The FileXfer application is a system for automated file transfer jobs for copying files. “There are 3 applications that make up the usage collection framework: `filexfer`, which does the actual file transfers; `filexfer-jobmonitor`, which is configured to monitor various aspects of jobs and create NMS alarms when necessary; and `filexfer-dataloader`, which bulk-loads file data into database tables. There are also house-keeping scripts called `filexfer-filearchive`, which keeps files in the data directory pruned and compressed, and `filexfer-fileunarchive`, which allows files to be pulled out of the archive so filexfer jobs can work with them again.”¹

4.4 Logging

Application Logging

The filexfer applications log to the `/var/log/filexfer` directory on `prod-prov4-cdr1.Operations.gci.com`. The parent filexfer jobs log to `filexfer-get.log` and `filexfer-put.log`. The jobmonitor and dataloader applications log to `jobmonitor.log` and `dataloader.log`. The filexfer applications log to the `/var/log/filexfer` directory on `prod-prov4-cdr1.Operations.gci.com`. The parent filexfer jobs log to `filexfer-get.log` and `filexfer-put.log`. The jobmonitor and dataloader applications log to `jobmonitor.log` and `dataloader.log`, respectively. Each file transfer job is executed as a child process and gets its own log file. The format is `filexfer-{neName}-{idJob}-{get,put}.log`.

By default, the jobs log at the warn level. Adjust the level to info to get a high-level view of the application's state. Adjust log verbosity by modifying the appropriate config file in `/etc/filexfer`. The changes will take effect after the next program execution.

Errors are also logged to a database table which can be browsed in the filexfer web interface under the 'Logs & Errors' view. This view includes messages logged at `warn`, `error`, and `fatal` severity.²

File Transfer Logging

Every file transfer is recorded in a database table. There are two reasons for this table: first, it tells `filexfer` which files have already been transferred, and second, it provides an audit trail for SOX compliance. The table is `filexfer.logs` on `sadc-cdr-mysql1.Operations.gci.com`. Use the `filexfer.joblogs` view to easily find logs by job name or network element ID.

²[Usage Collection Framework \(filexfer\)](#)

File transfer logs may also be viewed in the 'Logs & Errors' page of the web interface.³

³Usage Collection Framework (filexfer)

4.5 Test

[FIXME: Need data here...]

4.6 Issues

[FIXME: Need data here...]

5 Operation

[FIXME: Need data here...]

5.1 Job Scheduling

Jobs are scheduled using a web interface at `nms.operations.gci.com/relevance`. Navigate to the “FileXfer” application and click the “File Transfer Jobs” link. Job execution happens on `prod-prov4-cdr1.operations.gci.com`. A `cron` job executes every minute from `/etc/cron.d/filexfer` to kick off the various `filexfer` scripts.⁴

Job Timing

The parent `filexfer` script is responsible for spawning child processes for each job. Since a large number of jobs can be scheduled at any given interval, the parent process limits how many children can run concurrently. As long as the limit is reached and more jobs need to be spawned, the parent process must stay alive. Since this may take longer than 1 minute, it is possible for `filexfer` to miss certain scheduling intervals.

For example, if 500 jobs are scheduled to run at the top of every hour (`0 * * * *`) and the maximum child process limit is 50, there is a good chance `filexfer` will not execute any jobs scheduled to run at 1 minute past the hour (`1 * * * *`). The best way to avoid this is to use 0, 15, 30, or 45 in the minute field of the job schedule. These intervals are always executed.⁵

5.2 Dataloader

Dataloader jobs are configured using the web interface at `nms.operations.gci.com/relevance`. Navigate to the “FileXfer” application and click the “Data Load Jobs” link. These jobs are executed every minute as long as there are files in the load queue.⁶

⁴Usage Collection Framework (`filexfer`)

⁵Job Timing

⁶Usage Collection Framework (`filexfer`)

Appendix

Source

There are 3 primary FileXfer perl scripts on prod-prov4-cdr1:⁷

132
133 =over 4
134
135 =item -d, --piddir
136
137 Directory where the pid file will be written. Defaults to /var/run
    ↪ /filexfer.
138
139 =item --db
140
141 Sets the database connection parameters. Valid keys are: server (
    ↪ default
142 localhost), port (default 3306), driver (default mysql), uid, pwd,
    ↪ database,
143 and table. Specify tags as key/value pairs, e.g.:
144
145     --db server=localhost --db database=filexfer
```

```
146
147 =item -e, --evengehost
148
149 Address of the Evenge web server. Used to send indicators and
    ↪ events to the NMS system.
150
151 =item --evengetimeout
152
153 Timeout in seconds for communicating with the Evenge web server.
    ↪ Defaults to 10.
154
155 =item -f, --cachefile
156
157 Template cache file location. Defaults to /var/lib/filexfer/
    ↪ filexfer.kch.

63
64 =head1 NAME
65
66 filexfer-dataloader — Bulk load file data from filexfer into a
    ↪ database table.
67
68 =head1 VERSION
69
70 0.51
71
72 =head1 SYNOPSIS
73
74 filexfer-dataloader -c configfile [options]

```

```
75
76 =head1 ARGUMENTS
77
78 =over 4
79
80 =item -c, --configfile
81
82 Specify the configuration file to load. Must be in YAML format.
83
84 =back
85
86 =head1 OPTIONS
87
88 =over 4
89
90 =item -d, --piddir
91
92 Directory where the pid file will be written. Defaults to /var/run
    ↪ /filexfer.
93
94 =item --db
95
96 Sets the database connection parameters. Valid keys are: server (
    ↪ default
97 localhost), port (default 3306), driver (default mysql), uid, pwd,
    ↪ database,
98 and table. Specify tags as key/value pairs, e.g.:
99
100     --db server=localhost --db database=filexfer
101
102 =item -e, --evengehost
103
104 Address of the Evenge web server. Used to send indicators and
    ↪ events to the NMS system.
105
106 =item --evengetimeout
107
108 Timeout in seconds for communicating with the Evenge web server.
    ↪ Defaults to 10.
109
110 =item -f, --cachefile
111
112 Template cache file location. Defaults to /var/lib/filexfer/
    ↪ dataloader.kch.
```

```

113
114 =item -h, --help
115
116 Output this documentation.
117
118 =item -p, --pidfile
119
120 PID file name. This will be appended with a ".pid" suffix.
121
122 =item -r, --resource
123
124 Resource name of this application. Used in indicator and event
    ↪ messages sent to the NMS system.
125
126 =item --verbose, -v
127
128 Log to the screen at increasingly verbose levels. This option may
    ↪ be repeated
129 multiple times to increase the log level. For example, "-v" logs
    ↪ at info level,
130 "-vv" logs at debug level, and "-vvv" logs at trace level.
131
132 =back

```

[FIXME: Need data here]

L^AT_EX - Examples and Formatting

Comments

COMMENTS Comment — *Sean Weems, Spring 2003*

We should get the COMMENTS column searchable via the landrecords application before we do much anything else – shouldn't be too hard.

Errata: Plats spanning multiple sections

A few anomalies can be observed in the AKPLATS table. Specifically plats exist that span multiple sections. Since the table only has a single column, SCODE, that accepts a single section code, SGU (Status Graphics Unit) has handled this problem by entering multiple rows in the table, each with a different section that point to the same plat or file. Multiple section plats are indicated by setting the TCODE column to the value 37, and making an appropriate notation like *Section 24-25-26-27* in the REMARKS column.

[FIXME: Perhaps the SCODE column should accept an array of sections?]
